Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 10 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or pulmonary disease. The subjects were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of aerobic exercise at 60% of maximum HR. The control group did not exercise. The subjects were monitored for HR and EE at rest and during exercise. The results showed that the training program had a significant effect on HR and EE. The HR at rest decreased from 72 to 68 beats per minute, and the EE at rest decreased from 1,200 to 1,100 kcal per day. The HR during exercise increased from 140 to 150 beats per minute, and the EE during exercise increased from 1,800 to 2,200 kcal per day. The results suggest that a 10-week training program can improve the cardiovascular and metabolic health of sedentary, middle-aged women.
